

The diagram illustrates an identity between two expressions representing interactions between two manifolds, $\mathfrak{M}$ and $\mathfrak{N}$.

On the left, a vertical rectangle is divided into two sections labeled $\mathfrak{M}$ and $\mathfrak{N}$. Four horizontal lines connect the two sections, each with an arrow pointing from $\mathfrak{M}$ to $\mathfrak{N}$. These lines are labeled j_1 , j_2 , j_3 , and j_4 from top to bottom.

This is followed by an equals sign, indicating that the left-hand side is equal to the sum of two terms on the right.

The first term on the right shows the same manifolds $\mathfrak{M}$ and $\mathfrak{N}$, but the four lines from $\mathfrak{M}$ converge at a vertex, then pass through a vertical internal propagator labeled J , and finally diverge at another vertex to connect to $\mathfrak{N}$. The lines from $\mathfrak{M}$ are labeled j_1, j_2, j_3, j_4 from top to bottom.

The second term on the right is similar, but the internal propagator is labeled J and the lines from $\mathfrak{N}$ are labeled j_1, j_2, j_3, j_4 from top to bottom.

The two terms on the right are separated by a plus sign (+) and a minus sign (-), indicating that the right-hand side is the sum of the first term and the negative of the second term.
