

The diagram illustrates an identity between two Feynman diagrams. On the left, a triangle diagram with a mass insertion is shown. It features an internal line with a dot and arrows pointing in opposite directions, labeled $\dot{j}_3$ above and JM above. The left vertex is a triangle with a minus sign, and the right vertex is a triangle. Two external lines enter the left vertex, labeled $j_1 m_1$ and $j_2 m_2$. On the right, the diagram is expressed as a sum of two terms. The first term is a scalar loop diagram with a dot on the top arc, labeled $+$ above and J inside. It is preceded by the factor $(-1)^{2j_1}$. The second term is another triangle diagram with a plus sign at the left vertex and an external line labeled JM at the right vertex. Two external lines enter the left vertex, labeled $j_2 m_2$ and $j_1 m_1$.

$$\begin{array}{c} j_1 m_1 \\ \nearrow \\ \triangleleft - \\ \searrow \\ j_2 m_2 \end{array} \begin{array}{c} \dot{j}_3 \\ \leftarrow \bullet \rightarrow \\ JM \end{array} = (-1)^{2j_1} \begin{array}{c} + \\ \circlearrowleft J \\ \circlearrowright \end{array} + \begin{array}{c} j_2 m_2 \\ \nearrow \\ \triangleleft + \\ \searrow \\ j_1 m_1 \end{array} JM$$
