

The diagram illustrates a reduction of a Feynman diagram. On the left, a horizontal line with a double arrow pointing right is labeled $j_3 m_3$. This line enters a vertex from the left. From this vertex, a vertical dashed line (tadpole) extends downwards. Another solid line with a double arrow points right from the same vertex, labeled $+ j'_3 m'_3$. This solid line enters a circular loop. The loop has two vertices. The top vertex is labeled $-j_1$ and the bottom vertex is labeled j_2 . A dashed line connects the two vertices on the left side of the loop. The loop itself has arrows indicating a clockwise flow. The entire loop structure is preceded by a plus sign.

This is followed by an equals sign. To the right of the equals sign, there are two terms added together. The first term is a horizontal line with a double arrow pointing right, labeled $j_3 m_3$, which enters a small white circle (a tadpole). A solid line with a double arrow points right from this circle, labeled $j'_3 m'_3$. The second term is a plus sign followed by a circular loop diagram. This loop has two vertices connected by a horizontal line with a double arrow pointing right. The top arc of the loop is labeled j_1 and the bottom arc is labeled j_3 . The horizontal line is labeled j_2 . The loop has arrows indicating a clockwise flow.
